Comprehensive Device Model Report

Author: Area Estimator Generator

Date: 2026-07-18

PDK: IHP-Open-PDK SG13G2 | **Tool:** Magic 8.3.637 | Python 3

2. Executive Summary

This tool provides analog and mixed-signal (AMS) designers with a highly accurate method for estimating the physical layout area of a design directly from a SPICE netlist, specifically tailored for the IHP SG13G2 130nm process.

It supports **11 device types** across MOSFETs, Resistors, MIM Capacitors, and SiGe HBTs. The models were fitted against **350+ exact physical Magic VLSI bounding box measurements**, achieving R^2 goodness-of-fit scores > 0.999 across all devices.

3. Process Overview

IHP SG13G2 is a 130nm SiGe:C BiCMOS technology featuring high-performance bipolar transistors ($f_T \approx 350$ GHz) alongside standard 1.2V and 3.3V CMOS. The backend includes 5 thin and 2 thick metal layers, along with high-density MIM capacitors.

4. Mathematical Models

MOSFET Model

$$\text{Area} = (a_h \cdot W + b_h) \times (a_w \cdot L \cdot n_f + b_w \cdot n_f + c_w) \times m$$

Resistor Model

$$\text{Area} = \text{slope} \cdot L + \text{intercept} \quad (\text{where slope \& intercept depend on } W)$$

MIM Capacitor Model

$$\text{Area} = (W + 2 \cdot \text{border}) \times (L + 2 \cdot \text{border}) \times m$$

HBT Fixed-Emitter Model

$$\text{Area} = \text{fixed_h} \times (a_w \cdot n_x + b_w) \times m$$

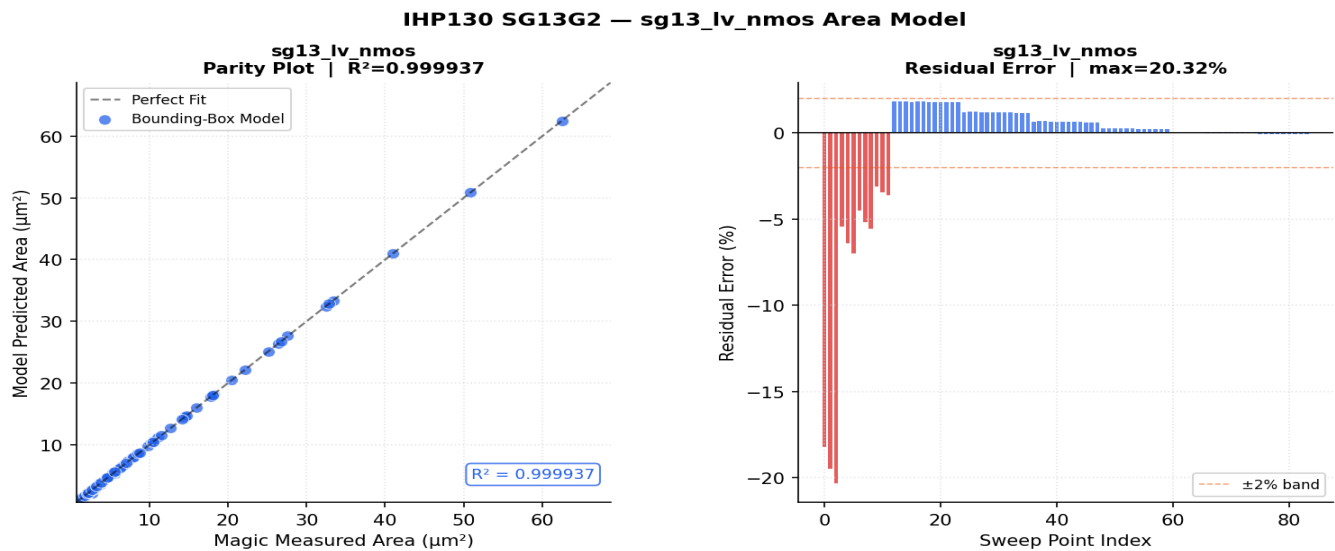

HBT Variable-Emitter Model

$$\text{Area} = (a_h \cdot l + b_h) \times (a_w \cdot n_x + b_w) \times m$$

7. Validation Results

The model database passes strict automated testing:

1. **verify_coefficients.py (129/129 pass)**: Validates R^2 integrity and coefficient math.
2. **validate_db_and_estimator.py (87/87 pass)**: Checks physical monotonicity (e.g. $\text{Area}(W=4) > \text{Area}(W=1)$).
